LABORATORY MANUAL

By
Prasant Behera
Lecturer in chemistry
Govt. Polytechnic Mayurbhanj

CERTIFICATE

This is to certify that Mr. /Miss_____

Of_____semester,Branch_____bearing

Class Roll no _____and S.C.T.E & V.T. Regd. No. _____

Of _____Institute during the

Year _____has completed the practical sessional work in_____

_____(Subject) as per curriculum

Prescribed by S.C.T.E. & V.T., ODISHA.

Lecturer

Principal

CONTENTS:

Sl. No.	Name of experiment	Page no.	Date of experiment performed	Mark	Sign. of lecturer	Remark
1.	Preparation and study of physical and chemical properties of CO ₂ gas.					
2.	Preparation and study of physical and chemical properties of NH ₃ gas.					
3.	Crystallization of copper sulphate (CuSO ₄) from copper carbonate(CuCO ₃)					
4.	Simple acid base titration (i) Acidimetry (ii) Alkalimetry					
5.	Test for acid radical (known) (i) carbonate (ii) sulphide (iii) chloride (iv) nitrate (v) sulphate					
6.	Test for basic radical (known) (i) ammonium (ii) zinc (iii) magnesium (iv) aluminium (v) calcium (vi) sodium (vii) potassium					
7.	Test for unknown salt (composed of one basic radical and one acid radical)					

EXPERIMENT NO. 1

Preparation of carbon dioxide gas

OBJECTIVE OF THE EXPERIMENT:

At the end of the experiment, students will be able to –

- a) Specify the chemicals, which are being used for preparation of carbon dioxide gas in the laboratory.
- b) Know the physical and chemical properties of the gas.

1. AIM OF THE EXPERIMENT: To prepare carbon dioxide gas in the laboratory and study its properties.

2. APPARATUS REQUIRED:

- a) Woulf's bottle
- b) Thistle funnel
- c) Delivery tube
- d) Cork
- e) Gas jar with lid
- f) Test tubes

3. CHEMICALS REQUIRED

- a) Marble chips
- b) Dilute Hydrochloric acid (HCl)
- c) Litmus Paper
- d) Magnesium ribbon
- e) Lime water

4.THEORY: Carbon dioxide gas is prepared in the laboratory by the action of dilute hydrochloric acid on marble (CaCO_3).

5. PROCEDURE

- (i) Take a Woulf's bottle fitted with cork, thistle funnel and delivery tube.
- (ii) Put some marble pieces into the woulf's bottle.
- (iii) Pour some water into woulf's bottle through the thistle funnel such that its lower end dips under water and marble pieces covered by it.

(Preparation of CO₂ gas)

- (iv) Now pour some dilute hydrochloric acid down the thistle funnel.
- (v) Allow the gas to escape for some time so that the air is driven out.
- (vi) Collect the carbon dioxide gas in the gas jar by upward displacement of the air. Test the gas collected in the gas jar by showing a burning splinter at the mouth of the gas jar.
- (vii) Study the properties of CO₂ by collecting the gas by in different test tubes.

6. PHYSICAL PROPERTIES

Experiment	Observation	Inference
(i) Color of the gas Note the color of the gas (ii) Odour of the gas Note the odour of the gas (iii) Solubility Invert the gas jar in a trough of water (iv) Density Place a gas jar inverted over an empty jar		

7. CHEMICAL PROPERTIES

(i) Introduce a burning splinter into the gas jar (ii) Action towards litmus A moist blue litmus paper is shown to the gas (iii) a-pass the gas coming out of the delivery tube into lime water taken in a test tube b-pass the gas in excess (iv) magnesium ribbon test Introduce a burning magnesium ribbon into a gas jar containing CO ₂ gas (v) Add few drops of water into the gas jar and shake it and put a red litmus paper into the gas jar		
---	--	--

7. PRECAUTIONS:

- Apparatus should be air tight.
- Thistle funnel must dip inside the acid.
- Acid should be added a little at regular interval.

EXPERIMENT NO-2

Preparation of ammonia gas

OBJECTIVE OF THE EXPERIMENT:

At the end of the experiment, students will be able to –

- a) Specify the chemicals, which are being used for preparation of carbon dioxide gas in the laboratory.
- b) Know the physical and chemical properties of the gas.

1. AIM OF THE EXPERIMENTS: To prepare and study the physical and chemical properties of ammonia gas in the laboratory.

2. APPARATUS REQUIRED:

- a) Rubber Cork
- b) Hard glass test tube
- c) Gas jar
- d) Clamp stand
- e) Delivery tube
- f) Test tubes

3. CHEMICALS REQUIRED:

- a) Solid ammonium chloride (NH_4Cl)
- b) Slaked lime $\text{Ca}(\text{OH})_2$
- c) Litmus Paper
- d) Conc. HCl
- e) Nessler's reagent
- f) Ferric chloride
- g) CuSO_4 solution

4. THEORY:

Ammonia gas is prepared in the laboratory by a mixture of solid ammonium chloride and slaked lime in 1:3 ratio. The gas is collected by the downward displacement of air as it is lighter than air.

CHEMICAL EQUATION:

5. PROCEDURE:

- (i) Take ammonium chloride and slaked lime in 1:3 ratio in a mortar and mix thoroughly.
- (ii) Take the mixture in a hard glass test tube to the half of the test tube.
- (iii) Fit the cork with delivery tube in to the mouth of the test tube and clamp the hard glass test tube into the clamp stand.
- (iv) Heat the hard glass test tube continuously.
- (v) Allow the gas to escape for some time so that the air is driven out.
- (vi) Collect the NH_3 gas in the gas jar by downward displacement of the air.
- (vii) Study the properties of NH_3 by collecting the gas by in different test tubes.

(Preparation of NH_3 gas)

6. PHYSICAL PROPERTIES

Experiment	Observation	Inference
(i) Color of the gas Note the color of the gas (ii) Odour of the gas Note the odour of the gas (iii) Solubility Invert the gas jar in a trough of water		

7. CHEMICAL PROPERTIES

Experiment	Observation	Inference
(i) Introduce a burning splinter into the gas jar (ii) Action towards litmus A moist red litmus paper is shown to the gas (iii) Dip a glass rod Conc. HCl and show to the NH_3 gas (iv) Pass the NH_3 gas coming out of the delivery tube into Nessler's reagent taken in a clean dry test tube. (v) Pass the NH_3 gas coming out of the delivery tube into 2ml of ferric chloride solution. (vi) Pass the NH_3 gas into 2ml of aqueous CuSO_4 solution slowly and then in excess.		

7. PRECAUTIONS:

- Apparatus must be made by proper air tight.
- Heat should be provided uniformly.
- The hard glass test tube should be fixed in inclined position towards its mouth in order to prevent crack on it.
- Gas jar should be dried.

EXPERIMENT NO-3

Preparation of Copper Sulphate Crystal from Copper Carbonate

1. AIM OF THE EXPERIMENTS: To prepare copper sulphate crystals from copper carbonate.

2. APPARATUS REQUIRED:

- a) Beaker
- b) Glass rod
- c) Tripod stand
- d) Wire gauze
- e) Bunsen burner
- f) Filter stand
- g) Filter paper
- h) Porcelain basin

3. CHEMICALS REQUIRED:

- a) Copper carbonate (CuCO_3)
- b) Dilute H_2SO_4

4. THEORY:

When Copper carbonate (CuCO_3) reacts with Dilute H_2SO_4 , soluble Copper Sulphate is formed. Then the Copper Sulphate solution is heated till the crystallization point is reached. On cooling the resulting solution, the crystal of Copper Sulphate separates out.

CHEMICAL EQUATION:

5. PROCEDURE:

Preparation of Solution

- (i) Take 25ml of dil. H_2SO_4 in a beaker.
- (ii) Add CuCO_3 gradually to dilute H_2SO_4 .
- (iii) Addition of CuCO_3 is continued till a little quantity of CuCO_3 is left behind.
- (iv) Heat the resulting solution to remove CO_2 .
- (v) Filter the solution into a porcelain basin.
- (vi) Add a few drops of dil. H_2SO_4 to the filtrate to check hydrolysis of salt.

Concentrating the Filtrate

- (i) Evaporate the filtrate in the basin with constant stirring.
- (ii) The process of evaporation is continued till a drop of the solution forms a crystal on the glass rod, when blown on it.

Crystallization

- (i) The filtrate of hot saturated solution is cooled down slowly to start the process of crystallization.
- (ii) For getting better quality of crystal, a crystal of CuSO_4 is added so that it finds a place in the middle of the solution. If the beaker is undisturbed and let it cool.

Filtration and drying of crystal

- (i) When the process of crystallization is over decant the mother liquor.
- (ii) The crystals of CuSO_4 are then washed with cooled water.
- (iii) Dry the crystal keeping those in between two folds of filter paper.
- (iv) Submit required quantity of CuSO_4 crystal.

6. PRECAUTIONS:

- a) Minimum point of dil. H_2SO_4 should be used to prepare the solution.
- b) The solution should be slightly acidic otherwise the salt may get hydrolyzed.
- c) The solution should not be heated beyond its crystallization point.
- d) The crystal should never be dried by heating.

EXPERIMENT NO- 4

SIMPLE ACID BASE TITRATION

4(a).ACIDIMATRY

AIM OF THE EXPERIMENT: To find out the strength of acid by using a standard alkali solution of strength 1.0 (N/10) in the laboratory.

APPARATUS REQUIRED:

- a) Burette (50ml)-1no.
- b) Pipette (10ml)-1no
- c) Conical flask (250ml)-1no.
- d) Beaker (500ml)-2no.
- e) Wash bottle-1no
- f) Burette stand with clamp-1 set
- g) Funnel-2no.

CHEMICALS REQUIRED:

- a) Sodium carbonate solution (Na_2CO_3)-Alkali solution.
- b) Sulphuric acid solution (H_2SO_4)

THEORY:

The principle of Acidimetry is

$$V_A \cdot S_A = V_B \cdot S_B$$

Where V_A = Volume of acid used (Burette reading)

S_A = Strength of acid (Unknown)

V_B = Volume of alkali used (Pipette reading)

S_B = Strength of alkali (standard solution)

PROCEDURE:

1. Clean the apparatus with water.
2. Wash the burette thoroughly with water then rinse with a little amount of acid.
3. Fill the burette with acid solution to a little above the “zero mark”. Open the stopcock for a moment in order to fill the jet with the acid that no air bubble will remain in the burette. Then clamp the burette vertically to the burette stand.
4. Take a clean pipette of 10ml capacity. Rinse the pipette with the standard alkali solution thrice.
5. Suck the alkali solution in to the pipette just a little above the mark. Close the upper open end immediately with index figure firmly. Wipe out the adhering liquid from the

outside of lower stem with filter paper. Now release the index figure slightly and transfer the alkali in to a conical flask slowly but continuously. Touch the tip of the stem thrice slowly with the bottom of the flask.

6. Add one drop of ethyl orange indicator to the alkali solution and shake well. The color of the solution becomes straw yellow.
7. Now place the conical flask containing alkali on the white glazed tile below the burette. Note down the initial reading of the burette.
8. Slowly add the acid solution from the burette to the alkali solution in the conical flask until the color of the solution becomes pale yellow.
9. Continue the addition of the acid solution drop wise while swirling the solution in the flask continuously. Stop adding acid at the point when the color of the solution just changes in to light pink. This the end point. Note down final burette reading (F.B.R). This will be the rough reading.
10. Repeat the process of addition of acid solution to the alkali solution thrice. All the three readings should be concordant.

OBSERVATION:

No. of observation	Volume of alkali in ml.	Initial burette reading in ml.	Final burette reading in ml.	Difference in ml.	Mean in ml.	Remark
1	10					
2	10					
3	10					
4	10					

CALCULATION:

We know that $V_A \cdot S_A = V_B \cdot S_B$

Where V_A = Burette reading (diff in ml)

V_B = Pipette reading (volume of alkali)

S_B = 0.1 N or N/10

$S_A = ???$

Thus $S_A = V_B \cdot S_B / V_A$ (N/10)

CONCLUSION: From the above titration, the strength of unknown acid solution is found to be ----- (N/10).

Precautions

1. The air bubbles in the nozzle of the burette must be removed before taking the initial reading.
2. To take the correct burette reading, use anti parallax card.
3. Alkali should be taken in a conical flask and acid in the burette, because if we take acid in the conical flask, during pipetting out of the acid, it may enter into the mouth thus by causing injury.
4. The small amount of alkali which remains inside the pipette during transferring the solution from pipette to conical flask, should not be blown in to the conical flask.
5. Indicator should not be added in excess.

6. The conical flask should always be placed under the burette on a white glazed tile.
7. Acid must be added to the alkali drop by drop as the end point approaches.
8. The solution in the conical flask should be continuously shaken while acid is added to alkali from the burette.

4(b).ALKALIMATRY

AIM OF THE EXPERIMENT: To find out the strength of alkali by using a standard acid solution of strength 1.01(N/10) in the laboratory.

APPARATUS REQUIRED:

1. Burette (50ml)-1no.
2. Pipette (10ml)-1no
3. Conical flask (250ml)-1no.
4. Beaker (500ml)-2no.
5. Wash bottle-1no
6. Burette stands with clamp-1 set
7. Funnel-2no.

CHEMICAL REQUIRED:

- 1) Sodium carbonate solution(Na_2CO_3)-Alkali solution.
- 2) Sulphuric acid solution (H_2SO_4)-Acid solution.

Theory:

The principle of Alkalimetry is

$$V_A.SA=V_B.SB$$

Where V_A =Volume of acid used(Burette reading)

SA =Strength of acid standard solution

V_B = Volume of alkali used (Pipette reading)

SB = Strength of alkali (unknown)

PROCEDURE:

1. Clean the apparatus with water.
2. Wash the burette thoroughly with water then rinse with a little amount of acid.
3. Fill the burette with acid solution to a little above the “zero mark”. Open the stopcock for a moment in order to fill the jet with the acid that no air bubble will remain in the burette. Then clamp the burette vertically to the burette stand.
4. Take a clean pipette of 10ml capacity. Rinse the pipette with the standard alkali solution thrice.
5. Suck the alkali solution in to the pipette just a little above the mark. Close the upper open end immediately with index figure firmly. Wipe out the adhering liquid from the outside of lower stem with filter paper. Now release the index figure slightly and transfer the alkali in to a conical flask slowly but continuously. Touch the tip of the stem thrice slowly with the bottom of the flask.
6. Add one drop of ethyl orange indicator to the alkali solution and shake well. The color of the solution becomes straw yellow.
7. Now place the conical flask containing alkali on the white glazed tile below the burette. Note down the initial reading of the burette.
8. Slowly add the acid solution from the burette to the alkali solution in the conical flask until the color of the solution becomes pale yellow.

9. Continue the addition of the acid solution drop wise while swirling the solution in the flask continuously. Stop adding acid at the point when the color of the solution just changes in to light pink. This the end point. Note down final burette reading (F.B.R). This will be the rough reading.

Repeat the process of addition of acid solution to the alkali solution thrice. All the three readings should be concordant.

OBSERVATION:

No. of obs	Volume of alkali in ml	Initial burette reading in ml	Final burette reading in ml	Difference in ml	Mean in ml	Remark
1	10					
2	10					
3	10					
4	10					

CALCULATION:

We know that $V_A.S_A = V_B.S_B$

Where V_A =Burette reading (diff in ml)

V_B = Pipette reading (volume of alkali)

S_A = 0.1 N or N/10

S_B =???

Thus $S_B = V_A.S_A/V_B$ (N/10)

CONCLUSION: From the above titration, the strength of unknown alkali solution is found to be -----
----- (N/10).

PRECAUTIONS:

- The air bubbles in the nozzle of the burette must be removed before taking the initial reading.
- To take the correct burette reading, use anti parallax card.
- Alkali should be taken in a conical flask and acid in the burette, because if we take acid in the conical flask, during pipetting out of the acid, it may enter into the mouth thus by causing injury.
- The small amount of alkali which remains inside the pipette during transferring the solution from pipette to conical flask, should not be blown in to the conical flask.
- Indicator should not be added in excess.
- The conical flask should always be placed under the burette on a white glazed tile.
- Acid must be added to the alkali drop by drop as the end point approaches.
- The solution in the conical flask should be continuously shaken while acid is added to alkali from the burette.

EXPERIMENT NO- 5

Test for acid radical (known)

STUDY OF PHYSICAL PROPERTIES OF SALT

Experiment	Observation	Inference
(a)Note the color	Colorless or white	Most of $\text{Na}^+, \text{K}^+, \text{Mg}^{2+}, \text{Ca}^{2+}, \text{Al}^{3+}, \text{Zn}^{2+}, \text{NH}_4^+$ salt etc.,
(b)structure	(i) crystalline (ii) amorphous	Most of the chlorides, nitrates, sulphates etc. Carbonates and sulphides of $\text{Ca}^{2+}, \text{Mg}^{2+}, \text{Zn}^{2+}$ etc.(except those of Na^+, K^+ and NH_4^+)
(c)solubility	Soluble in water	Carbonates and sulphides of Na^+, K^+ and NH_4^+), all halides, all nitrates, all sulphates,

TEST FOR ACID RADICAL

DRY TEST FOR ACID RADICALS

Experiment	Observation	Inference
Heat a small quantity of the supplied salt in a clean dry test tube fast slowly and then strongly for about three to four minutes.	A gas or vapour is evolved. (i) A colorless and odourless gas(O_2) which rekindles a glowing splinter (ii) A colorless and pungent smelling gas (NH_3) which turns red litmus paper blue. (iii) A colorless and odourless gas which turns lime water milky (iv)a colorless gas (SO_2) with burning sulphur smell which turns acidified $\text{K}_2\text{Cr}_2\text{O}_7$ solution green (v)a colorless gas (HCl)with irritating smell which fumes in moist air. it produces dense white fumes with a glass rod	May be Nitrates of Na^+ and K^+ May be Certain ammonium salts May be carbonates May be sulphate May be hydrated chloride salt.

	dipped in conc.NH ₄ OH (vi) a colorless gas(H ₂ S) with rotten egg smell which turns lead acetate paper black.	May be hydrated sulphide salts.
--	--	---------------------------------

WET TEST FOR ACID RADICALS

1.Test for carbonate (CO₃²⁻)

Experiment	Observation	Inference
(a)Take 2ml of dilute HCl in a clean test tube. Warm it and add a little of the salt in to it.	Effervescence takes place with evolution of colorless & odourless gas.	May be CO ₂ gas from CO ₃ ²⁻ . [Na ₂ CO ₃ +2HCl → 2NaCl+H ₂ O+CO ₂]
(b)Show a glowing splinter to the colorless & odorless gas.	The splinter extinguishes.	CO ₂ gas from CO ₃ ²⁻ .
(c)Pass the gas into lime water and then in excess.	Lime water turns milky on excess of gas milkyness disappears.	CO ₃ ²⁻ confirmed.

2. Test for Sulphide radical (S²⁻)

Experiment	Observation	Inference
(a)Take 2ml of dilute HCl in a clean test tube. Warm it and add a little of the salt in to it.	Effervescence takes place with evolution of a gas having rotten egg smell.	May be H ₂ S gas from sulphide.
(b)Show lead acetate paper to the color less gas with rotten egg smell.	Lead acetate paper turns black	PbS is formed which is black in color. S ²⁻ is confirmed
(c) Show a filter paper dipped in acidified KMnO ₄ solution to the evolved gas.	KMnO ₄ solution get decolorized.	S ²⁻ is confirmed.

3. Test for chloride radical

Experiment	Observation	Inference
(a)Take a pinch of the salt in a clean and dry test tube and add 2	A colorless fuming gas with pungent smell is evolved.	It may be HCl gas from Cl ⁻

<p>drops of conc. H_2SO_4 and warm it.</p> <p>(b) Show a glass rod dipped in conc. NH_4OH solution to the above gas.</p> <p>(c) Take a pinch of the salt in a clean and dry test tube. Add a little MnO_2 and 2-3 drops of conc. H_2SO_4 and heat it.</p> <p>(d) Take 1 ml of salt solution in a test tube. Acidify with 1 ml of dil. HNO_3 then add AgNO_3 solution.</p> <p>(e) wash the above precipitated with distilled water and divide into two parts</p> <p>(1) Add dil. HNO_3 and shake well.</p> <p>(2) Add dil. NH_4OH and shake well.</p>	<p>Evolution of dense white fumes and white solid deposited on the tip of the glass rod.</p> <p>A greenish yellow gas is evolved which turns starch iodide paper blue.</p> <p>A curdy white ppt. is formed.</p> <p>Precipitate is insoluble in dil. HNO_3</p> <p>Precipitate is insoluble in dil. NH_4OH.</p>	<p>It is due to the formation of NH_4Cl. Cl^- may be present.</p> <p>Cl^- may be present.</p> <p>It is due to the formation of AgCl. Cl^- confirmed.</p> <p>AgCl is not soluble in HNO_3</p> <p>AgCl is soluble in dil. NH_4OH due to formation of complex. Cl^- is confirmed.</p>
--	--	--

4. Test for Sulphate (SO_4^{2-})

Experiment	Observation	Inferences
<p>(a) Take about 1-2 ml of salt solution. Acidify with 1-2 ml of dil. HCl. Add about 1 ml of BaCl_2 solution. Add about 1 ml of Conc. HCl to the above solution and warm it.</p>	<p>A white precipitate is obtained. The precipitate is not soluble in HCl.</p>	<p>SO_4^{2-} is confirmed</p> $\text{Na}_2\text{SO}_4 + \text{BaCl}_2 \rightarrow \text{BaSO}_4 + 2\text{NaCl}$

5. Test for Nitrate (NO_3^-)

Experiment	Observation	Inferences
<p>(a) Take a pinch of salt in a clean and dry test tube. Add few pieces of copper turnings and 4-5 drops of conc. H_2SO_4 and heat it.</p> <p>(b) Show a filter paper soaked in freshly prepared FeSO_4 solution to the above brown gas.</p>	<p>Copious brown fumes are evolved and the solution turns green or bluish green.</p> <p>The paper turns black</p>	<p>Brown fume is due to NO_2 from nitrate NO_3^- salt.</p> $[\text{Cu} + 4\text{HNO}_3 \rightarrow \text{Cu}(\text{NO}_3)_2 + 2\text{H}_2\text{O} + 2\text{NO}_2]$

(c) Brown ring test take 1-2 ml of salt solution. add equal volume of conc. H_2SO_4 slowly in to the test tube. Cool the test tube perfectly under tap. Then slowly add 2-3 ml of freshly prepared ferrous sulphate solution through the sides of the test tube.	A brown ring is formed at the junction of the two liquid layers.	May be NO_3^- The brown ring is due to the formation of $[\text{Fe}(\text{H}_2\text{O})_5(\text{NO})]\text{SO}_4$ NO_3^- is confirmed
--	--	---

EXPERIMENT NO-6

Test for basic radical (known)

STUDY OF PHYSICAL PROPERTIES OF SALT

TEST FOR BASIC RADICAL

Dry test for basic radical

1. Dry test tube heating

Experiment	Observation	Inference
Heat a small quantity of the supplied salt in a clean dry test tube fast slowly and then strongly for about three to four minutes.	(a) water particles condense at the cooler part of the test tube (b) the salt volatilises out completely forming a white sublimate (c) the salt decrepitates (produces cracking sound) (d) The salt melts on heating and solidifies upon cooling. (e) The salt changes its color. Yellow when hot and white when cooled (f) the salt is swelled upon heating	Salt contains water of crystallization. Volatile salts. May be NH_4^+ salt Crystalline salts. Alkali and alkaline earth metal salts. May be zinc salt. May be Al^{3+} .

2. Test for volatile salts(Soda lime Test)

Experiment	Observation	Inferences
(a) Take a pinch of salt in a watch glass add a little soda lime ($\text{NaOH} + \text{CaO}$) and few drops of water to it. Rub it with the thumb.	A colorless gas with ammonia smell is observe	Ammonium salt is present
(b) A glass rod dipped in conc. HCl is shown to the evolved gas.	Copious evolution of dense white fumes.	Ammonium salt is present

3. Charcoal cavity heating

Experiment	Observation	Inferences
Make a small cavity on a charcoal block. Take a little of the salt in the cavity and heat it strongly in oxidizing flame with a blow pipe.	(i)The salt produces cracking sound. (ii) The salt deflagrates (suddenly catches fire and burns vigorously). (iii) The salt melts and sink in to the charcoal cavity on heating and reappears on cooling (iv) the salt may or may not melt (a) A white infusible in candescent (giving light) residue is obtained. (b) Salt becomes yellow when hot, white when cooled.	May be crystalline salt. May be nitrates. May be alkali or alkaline earth metals(Ca^{2+} , Mg^{2+} , Na^+ , K^+) (Flame test to be performed) May be aluminium. May be zinc salt. Performed cobalt nitrate test.

3. Cobalt Nitrate Test (for infusible salt)

Experiment	Observation	Inferences
Heat a small quantity of the salt in a charcoal cavity in the oxidizing flame with the help of a blow pipe till an infusible and in candescent residue is left. In Moisten the residue with a drop of cobalt nitrate solution and heat it in the oxidizing flame with the help of a blow pipe. Note the color of	(i) blue mass (ii) green mass (iii) Pink mass (iv) grey mass	May be Al^{3+} +salt. May be Zn^{2+} +salt. May be Mg^{2+} +salt. May be Ca^{2+} salt. (flame to be performed)

the residue.		
--------------	--	--

3. Flame Test (for fusible salts)

Experiment	Observation		Inferences
Clean a nichrome wire with sand paper. Dip it in conc. HCl kept in a watch glass. Show it to the flame. It should be done till no color is imparted to the flame. Moisten the nichrome wire with conc. HCl and touch it with a little of the salt. Now heat it in oxidizing flame and note the color of the flame through naked eye and through double blue glass.	Color through naked eye	Color through double blue glass	Name of the salt
	(a) Persistent golden yellow color	Colorless	Sodium (Na ⁺) salt.
	(b) Violet crimson red	Crimson red	Potassium (K ⁺) Salt.
	(c) Brick red	Light green	Calcium (Ca ²⁺) salt.

WET TEST FOR BASIC RADICAL

For wet test for basic radicals, salt solution is to be prepared. The solubility of the salt should be examined in the following solvents. First in cold water and if failed then in (a) hot water (b) Dil. HCl (c) Conc. HCl.

1. Test for Al³⁺

Experiment	Observation	Inference
(a) To 3ml of salt solution, add solid NH ₄ Cl till the solution is alkaline. Dil. NaOH is added drop wise and then in excess.	Gelatinous white precipitate is formed which dissolved in excess NaOH.	May be Al ³⁺
(b) Take 1 of salt solution in a test tube. Add Disodium hydrogen phosphate solution in it.	Gelatinous white precipitate of AlPO ₄ is formed which is soluble in dilute HCl.	Al ³⁺ is confirmed.
2. Test for Zn ²⁺		
(a) To 3ml of salt solution, add solid NH ₄ Cl saturation. Then add dil. NH ₄ OH till alkaline. Pass H ₂ S gas through it.	White precipitate is obtained due to formation of ZnS.	Zn ²⁺ is present.
(b) To 2ml of salt solution, add potassium Ferro cyanide solution drop by drop.	White precipitate is formed.	Zn ²⁺ is confirmed.
(c) To 2ml of salt solution, add dil. NaOH solution drop by drop then in excess.	White Precipitate is obtained which is soluble in excess of dilute NaOH.	Zn ²⁺ is confirmed.
3. Test For Ca ²⁺		
(a) To 3ml of salt solution, add solid NH ₄ Cl saturation. Then add dil. NH ₄ OH till alkaline. Now add	White precipitate of CaCO ₃ is obtained.	Ca ²⁺ present.

EXPERIMENT NO-7

Systematic procedure for detection of acid and basic radical in an unknown salt

AIM OF THE EXPERIMENT: To detect the acid and basic radical in an unknown salt.

PRELIMINARY TEST

- (i) Salt number
- (ii) Color of the salt
- (iii) Structure of the salt
- (iv) Solubility of the salt

1. DRY TEST TUBE HEATING

Experiment	Observation	Inference
Heat a small quantity of the supplied salt in a clean dry test tube fast slowly and then strongly for about three to four minutes.	(a) water particles condense at the cooler part of the test tube	Salt contains water of crystallization.
	(b) the salt volatilizes out completely forming a white sublimate	Volatile salts. May be NH_4^+ salt
	(c) the salt decrepitates (produces cracking sound)	Crystalline salts.
	(d) The salt melts on heating and solidifies upon cooling.	Alkali and alkaline earth metal salts.
	(e) The salt changes its color. Yellow when hot and white when cooled	May be zinc salt.
	(f) the salt is swelled upon heating	May be Al^{3+} .
	(g) A gas or vapour is evolved.	May be Nitrates of Na^+ and K^+
	(i) A colourless and odourless gas (O_2) which rekindles a glowing splinter	May be Certain ammonium salts
	(ii) A colourless and pungent smelling gas (NH_3) which turns red litmus paper blue.	May be carbonates
	(iii) A colourless and odourless gas which turns lime water milky	May be sulphate
	(iv) a colourless gas (SO_2) with burning sulphur smell which turns acidified $\text{K}_2\text{Cr}_2\text{O}_7$ solution green.	May be hydrated chloride salt.
	(v) a colourless gas (HCl) with irritating smell which fumes in moist air. it produces dense white fumes with a glass rod dipped in conc. NH_4OH .	May be hydrated sulphide salts.
	(vi) a colorless gas (H_2S) with	

	rotten egg smell which turns lead acetate paper black.	
--	--	--

2. TEST FOR VOLATILE SALTS (SODALIME TEST)

Experiment	Observation	Inferences
(a) Take a pinch of salt in a watch glass add a little sodalime (NaOH+CaO) and few drops of water to it. Rub it with the thumb. (b) A glass rod dipped in conc. HCl is shown to the evolved gas.	A colorless gas with ammonia smell is observe Copious evolution of dense white fumes.	Ammonium salt is present Ammonium salt is present

3. CHARCOAL CAVITY HEATING

Experiment	Observation	Inferences
Make a small cavity on a charcoal block. Take a little of the salt in the cavity and heat it strongly in oxidizing flame with a blow pipe.	(i) The salt produces cracking sound. (ii) The salt deflagrates (suddenly catches fire and burns vigorously). (iii) The salt melts and sink in to the charcoal cavity on heating and reappears on cooling (iv) the salt may or may not melt (a) A white infusible in candescent (giving light) residue is obtained. (b) Salt becomes yellow when hot, white when cooled.	May be crystalline salt. May be nitrates. May be alkali or alkaline earth metals (Ca ²⁺ , Mg ²⁺ , Na ⁺ , K ⁺) (Flame test to be performed) May be aluminium. May be zinc salt. Performed cobalt nitrate test.

3. COBALT NITRATE TEST (FOR INFUSIBLE SALT)

Experiment	Observation	Inferences
------------	-------------	------------

Heat a small quantity of the salt in a charcoal cavity in the oxidizing flame with the help of a blow pipe till an infusible and in candescent residue is left. In Moisture the residue with a drop of cobalt nitrate solution and heat it in the oxidizing flame with the help of a blow pipe. Note the color of the residue.	(i) blue mass	May be Al^{3+} salt.
	(ii) green mass	May be Zn^{2+} salt.
	(iii) Pink mass	May be Mg^{2+} salt.
	(iv) grey mass	May be Ca^{2+} salt. (flame to be performed)

3.FLAME TEST (FOR FUSIBLE SALTS)

Experiment	Observation		Inference
Clean a nichrome wire with sand paper. Dip it in conc.HCl kept in a watch glass. Show it to the flame. It should be done till no color is imparted to the flame. Moisten the nichrome wire with conc.HCl and touch it with a little of the salt. Now heat it in oxidizing flame and note the color of the flame through naked eye and through double blue glass.	Color through naked eye	Colour through double blue glass	Name of the salt
	(a) Persistent golden yellow color	Colorless	Sodium (Na^{+}) salt.
	(b) Violet crimson red	Crimson red	Potassium (K^{+}) Salt.
	(c) Brick red	Light green	Calcium (Ca^{2+}) salt.

WET TEST FOR ACID RADICALS

1. Test with dilute HCl.

Experiment	Observation	Inference
------------	-------------	-----------

<p>(a) Take 2 ml of dilute HCl in a clean test tube. Warm it and add a little of the salt in to it.</p> <p>(b) Test for CO₃²⁻. Pass the gas into lime water and then in excess.</p> <p>(c) Test for (S²⁻)</p> <p>(i) Show lead acetate paper to the colorless gas with rotten egg smell.</p> <p>(ii) Show a filter paper dipped in acidified KMnO₄ solution to the evolved gas.</p>	<p>(i) Effervescence takes place with evolution of colorless and odourless gas which extinguishes the burning splinter.</p> <p>(ii) Effervescence takes place with evolution of a gas having rotten egg smell.</p> <p>Lime water turns milky on excess of gas; milkiness disappears.</p> <p>Lead acetate paper turns black</p> <p>KMnO₄ solution gets decolorized</p>	<p>May be CO₂ gas from CO₃²⁻. $[\text{Na}_2\text{CO}_3 + 2\text{HCl} \rightarrow 2\text{NaCl} + \text{H}_2\text{O} + \text{CO}_2]$ <div style="text-align: center;">↑</div></p> <p>May be H₂S gas from sulphide CO₂ gas from CO₃²⁻.</p> <p>CO₃²⁻ confirmed.</p> <p>PbS is formed which is black in color. S²⁻ is confirmed.</p> <p>S²⁻ is confirmed.</p>
---	--	---

3. Test with conc. H₂SO₄

Experiment	Observation	Inference
------------	-------------	-----------

<p>(a) Take a pinch of the salt in a clean and dry test tube and add 2 drops of conc. H_2SO_4 and warm it.</p> <p>(b) Show a glass rod dipped in conc. NH_4OH solution to the above gas.</p> <p>(c) Take a pinch of the salt in a clean and dry test tube. Add a little MnO_2 and 2-3 drops of conc. H_2SO_4 and heat it.</p> <p>Confirmatory Test for Cl^-</p> <p>(a) Take 1 ml of salt solution in a test tube. Acidified with 1 ml of dil. HNO_3 then add AgNO_3 solution.</p> <p>(b) Wash the above precipitate with distilled water and divide it into two parts.</p> <p>(1) Add dil. HNO_3 and shake well.</p> <p>(2) Add dil. NH_4OH and shake well.</p>	<p>A colorless fuming gas with pungent smell is evolved.</p> <p>Evolution of dense white fumes and white solid deposited on the tip of the glass rod.</p> <p>A greenish yellow gas is evolved which turns starch iodide paper blue.</p> <p>A curdy white ppt. is formed.</p> <p>Precipitate is insoluble in dil. HNO_3. Precipitate is soluble in dil. NH_4OH.</p>	<p>It may be HCl gas from Cl^-. It is due to the formation of NH_4Cl.</p> <p>Cl^- may be present</p> <p>Cl^- may present.</p> <p>It is due to the formation of AgCl. Cl^- confirmed.</p> <p>AgCl is not soluble in HNO_3.</p> <p>AgCl is soluble in dil. NH_4OH due to formation of complex. Cl^- is confirmed.</p>
--	---	---

4. Action with conc. H_2SO_4 and copper turnings.

Experiment	Observation	Inferences
<p>(a) Take a pinch of salt in a clean and dry test tube. Add few pieces of copper turnings and 4-5 drops of conc. H₂SO₄ and heat it.</p> <p>(b) Show a filter paper soaked in freshly prepared FeSO₄ solution to the above brown gas. Confirmatory test for nitrate (NO₃⁻).</p> <p>(c) Brown ring test: Take 1-2 ml of salt solution. add equal volume of conc. H₂SO₄ slowly in to the test tube. Cool the test tube perfectly under tap. Then slowly add 2-3 ml of freshly prepared ferrous sulphate solution through the sides of the test tube.</p>	<p>Copious brown fumes are evolved and the solution turns green or bluish green.</p> <p>The paper turns black</p> <p>A brown ring is formed at the junction of the two liquid layers.</p>	<p>Brown fume is due to NO₂ from nitrate NO₃⁻ salt.</p> $[Cu + 4HNO_3 \longrightarrow Cu(NO_3)_2 + 2H_2O + 2NO_2]$ <p>May be NO₃⁻</p> <p>The brown ring is due to the formation of [Fe(NO)]SO₄. NO₃⁻ is confirmed</p>

5. Action with dil. HCl and BaCl₂.

Experiment	Observation	Inferences
<p>(a) Take about 1-2 ml of salt solution. Acidify with 1-2 ml of dil. HCl. Add about 1ml of BaCl₂ solution. Add about 1 ml of Conc. HCl to the above solution and warm it.</p>	<p>A white precipitate is obtained which is insoluble in conc. HCl.</p>	<p>SO₄²⁻ is confirmed</p> $Na_2SO_4 + BaCl_2 \longrightarrow BaSO_4 + 2NaCl$

WET TEST FOR BASIC RADICAL

For wet test for basic radicals, salt solution is to be prepared. The solubility of the salt should be examined in the following solvents. First in cold water and if failed then in (a) hot water (b) Dil. HCl (c) Conc. HCl.

Residue-1 (a)No residue	Filtrate-1 Warm the filtrate and then pass H_2S gas till complete precipitation then filter.				
	Residue-2	Filtrate-2 Warm the filtrate slightly. Then saturate it by adding solid NH_4Cl followed by dil. NH_4OH solution then filter.			
		Residue-3	Filtrate-3 Warm the filtrate slightly and then pass H_2S gas till complete precipitation and then filter.		
			Residue - 4	Filtrate – 4 Saturate the filtrate with $(\text{NH}_4)_2\text{CO}_3$ solution followed by solid NH_4Cl and NH_4OH . Then filter.	
				Residue-5	Filtrate – 5 Use this filtrate for the test of NH_4^+ , Na^+ , K^+ and Mg^{2+} .

1. Test for Al^{3+} .

Experiment	Observation	Inference
(a) To 3ml of salt solution, add solid NH_4Cl till the solution is alkaline. Dil. NaOH is added drop wise and then in excess.	Gelatinous white precipitate is formed which dissolved in excess NaOH .	May be Al^{3+}
(b) Take 1 of salt solution in a test tube. Add Disodium hydrogen phosphate solution in it.	Gelatinous white precipitate of AlPO_4 is formed which is soluble in dilute HCl .	Al^{3+} is confirmed.
2. Test for Zn^{2+}		
(a) To 3ml of salt solution, add solid NH_4Cl saturation. Then add dil. NH_4OH till alkaline. Pass H_2S gas through it.	White precipitate is obtained due to formation of ZnS .	Zn^{2+} is present.
(b) To 2ml of salt solution, add potassium Ferro cyanide solution drop by drop.		
(c) To 2ml of salt solution, add dil. NaOH solution drop by drop then in excess.	White precipitate is formed.	Zn^{2+} is confirmed.
3. Test For Ca^{2+}		
(a) To 3ml of salt solution, add solid NH_4Cl saturation. Then add dil. NH_4OH till alkaline. Now add saturated solution of $(\text{NH}_4)_2\text{CO}_3$ to it.	White Precipitate is obtained which is soluble in excess of dilute NaOH .	Zn^{2+} is confirmed.
(b) To 2ml of salt solution add 1ml. of ammonium oxalate solution. Make the solution alkaline with NH_4OH .	White precipitate of CaCO_3 is obtained.	Ca^{2+} present.
Test for Mg^{2+}		
(a) To 2ml of salt solution, add solid NH_4Cl till saturation. Then add dil. NH_4OH till alkaline. Add Disodium hydrogen phosphate solution.	White precipitate is formed	Ca^{2+} is confirmed.
(b) To 2ml of salt solution, add 1ml of dil. HCl . Then add a few drops of Magneson reagent followed by addition of dil. NaOH in excess.	White precipitate is obtained.	Mg^{2+} is present.
Test for (NH_4^+)		
(a) To 2ml of salt solution in a test tube, add dil. NaOH solution & boil.	A blue precipitate is obtained.	
(b) Show a glass rod dipped in conc. HCl to the above gas.		
(c) To 2ml of salt solution add 1ml of Nessler's reagent.	Ammonia gas is evolved.	Mg^{2+} is confirmed.
	Dense white fumes obtained.	

	A brown precipitate is obtained.	<p>NH₄⁺ is present.</p> <p>NH₄⁺ is confirmed.</p> <p>NH₄⁺ is confirmed.</p>
--	----------------------------------	---

Nessler' reagent: Nessler's reagent is an alkaline solution of potassium mercuric iodide.

<p>Test for (Na+) (a)Take 2ml of salt solution in a clean test tube. Add 1ml of potassium pyroantimonate solution</p>	White crystalline precipitate is obtained.	Na ⁺ is confirmed.
<p>Test for (K+) Take 2ml of salt solution .Add 6drops of cobalt nitrate solution followed by sodium nitrite and dil. acetic acid.</p>	Yellow precipitate is formed.	K ⁺ is confirmed.
